## THE PETER CASCIO NURSERY

Dear Customer:

The nursery stock recently purchased from us represents a capital investment. It is our desire that it grows, provides beauty, enjoyment and adds to the value of your property. To aid in having it accomplish the desired results we suggest reading the following cultural directions.

**WATERING** is our most important suggestion regarding newly set trees and plants. Because of varying weather conditions no definite schedule can be given. However, when first planted they should be watered once or twice a week for a month, and at least once a week thereafter, especially if there should be an extended dry period. Do not let light rains or heavy showers mislead you into thinking your plants have sufficient moisture. When watering give them a "good soaking". We suggest letting your hose, with nozzle off, run very slowly for fifteen minutes to an hour or more around each plant, depending on its size and dryness. Watering is a preventative not a cure. Water is inexpensive, use it regularly and generously.

**CULTIVATION** is especially beneficial during the first growing season. Loosening the soil around your plants permits better penetration of water from either rain or artificial application, destroys weeds which rob the soil of moisture and fertility, creates a mulch and permits air to get to the roots. Cultivate at least once a month and more if possible.

**MULCHING**, where practical, is quite beneficial. You can use Peat Moss, half rotted straw, old leaves, manure, grass clippings, shavings, etc. It should be applied 1" to 4" deep depending on the material, and extended far enough to cover the spread of the roots. A mulch will keep soil cool, hold moisture, smother out weeds and make penetration of water easier. This is a wonderful practice where water is limited.

**SPRAYING**. If there are indications of insect or fungus injury, your plants may need spraying. Call or write us for advice.

**PRUNING**. Very little pruning is needed the first year except for a little "shaping up".

**FEEDING**. One or two handfuls of a good commercial fertilizer worked into the soil around an average plant and watered in, will be beneficial. Working in well rotted manure is also excellent. Consult us about feeding large trees.

Trusting the above may be helpful in enabling you to get satisfactory results, we are

Sincerely yours,

THE PETER CASCIO NURSERY
